Logistic Regression:

1. What is the model's accuracy?

The model's accuracy is 70.37%

2. What is the model's lowest precision?

The model’s lowest precision is 56%.

3. Do all categories have at least 30 support? (confusion matrix)

Yes, both categories have at least 30 support, one with 130 and one with 59.

4. Based on the pseudo-R^2 value, is this model good in this scenario?

No, the model is not good in this scenario, with the pseudo R^2 model value being 6.25%.

Count-variable regression:

1. Your model should include 4 significant predictors. What are they?

The 4 significant predictors are depression_crudeprev, selfcare_crudeprev, indeplive_crudeprev, and loneliness_crudeprev.

2. Which of these predictors is the most significant (hint: look at the 'coef' column)

The most significant is selfcare_crudeprev, with the coefficient being -.0608.

3. Do any of your significant predictors have an overinflated VIF (VIF > 10)?

Yes, selfcare_crudeprev has an overinflated VIF of 30.51 and indeplive_crudeprev has an overinflated VIF of 30.95

4. How much of the variability is captured by the model (hint: look at pseudo-r^2)

The pseudo R^2 value of 4.36% shows not much variability is captured by the model.
